

More Energy for Milk and Components

Balanced Energy for Milk and Components

DigestaPalm contains palmitic and oleic acid. The oleic acid is added to help improve fat digestibility in the small intestine—Giving the cow more energy to use for milk and milk component production.

DigestaPalm Specifications	
Total Fat	99%
Palmitic	80%
Oleic	10%
Color	White to Cream
Physical Form	Free-Flowing Prill

We formulated (and control) the levels and ratio of palmitic acid to oleic acid to maximize digestibility. Some current products on the market exceed 95% palmitic acid and this compromises digestibility.

Ideal Times to Feed:

- When looking to increase milk fat and maintain body condition score
- In groups milking less than 110 pounds of milk

In groups milking more than 110 pounds of milk: Consider blending DigestaPalm with a calcium salt to increase the oleic acid level to 30%. (Research shows cows producing more than 110 pounds of milk respond favorable to higher oleic acid intake.)

Talk with your Dairy Focus Consultant about including DigestaPalm in your diets.
